After simmering, the wort is refrigerated and seeded with leaven. The yeast ferments the sugars into alcohol and gas. This process takes various days, and the resulting brew is then matured, clarified, and bottled for sale.

A4: Ales are brewed at higher degrees using high-fermentation yeast, while lagers are processed at less temperatures using bottom-fermenting yeast. This results in distinct taste characteristics.

The process of BEER making involves a series of carefully managed steps. First, cereals, usually barley, are sprouted to activate enzymes that change the carbohydrate into fermentable sugars. This malted grain is then mashed with hot water in a technique called mashing, which extracts the sugars. The resulting mixture, known as extract, is then simmered with bitter to provide aroma and preservation.
