Making Data Integration Work: How to Systematically Reduce Cost, Improve Quality, and Enhance Effectiveness Today's enterprises are investing massive resources in data integration. Many possess thousands of point-to-point data integration applications that are costly, undocumented, and difficult to maintain. Data integration now accounts for a major part of the expense and risk of typical data warehousing and business intelligence projects--and, as businesses increasingly rely on analytics, the need for a blueprint for data integration is increasing now more than ever. This book presents the solution: a clear, consistent approach to defining, designing, and building data integration components to reduce cost, simplify management, enhance quality, and improve effectiveness. Leading IBM data management expert Tony Giordano brings together best practices for architecture, design, and methodology, and shows how to do the disciplined work of getting data integration right. Mr. Giordano begins with an overview of the "patterns" of data integration, showing how to build blueprints that smoothly handle both operational and analytic data integration. Next, he walks through the entire project lifecycle, explaining each phase, activity, task, and deliverable through a complete case study. Finally, he shows how to integrate data integration with other information management disciplines, from data governance to metadata. The book's appendices bring together key principles, detailed models, and a complete data integration glossary. Coverage includes

- Implementing repeatable, efficient, and well-documented processes for integrating data
- Lowering costs and improving quality by eliminating unnecessary or duplicative data integrations
- Managing the high levels of complexity associated with integrating business and technical data
- Using intuitive graphical design techniques for more effective process and data integration modeling
- Building end-to-end data integration applications that bring together many complex data sources

The Tao of Computing provides readers with the knowledge, concepts, and skills necessary for computer fluency as defined in the National Research Council's report, Being Fluent with Information Technology. Motivated by a belief that students learn best when material connects with their experiences, backgrounds, and perspective, author Henry Walker has built The Tao of Computing around a unique question-and-answer format. Each chapter and section begins with a \"real-life\" computing question, the answer to which serves as the starting point for an in-depth discussion of a fluency-related concept. The questions have been carefully developed to be representative of those asked by general computer users and were, in many instances, posed by the author's students. Individually, they help students easily build an understanding of important IT concepts. As a whole, they address completely all of the topic areas that the NRC has defined as critical to developing IT fluency. The book's conversational format engages the reader and presents key material in a clear, easily understandable fashion for those with little or no background in computing, and helps them develop an \"IT vocabulary\" without overwhelming them with jargon and acronyms.

Fractions, Decimals, Percents

As 21st-century citizens of developed countries, we are constantly bombarded by numbers in every aspect of our lives. Almost automatically, we learn to interpret how numbers are used in our language, what magnitude of numbers we expect to hear in particular contexts, how people in our community express degrees of confidence in the reliability of any particular number, etc. Context of this kind is lacking when we read a historical narrative composed in an ancient language, from a world vastly different from ours. In *Quantifying Mentalities*, Catherine Rubincam helps overcome this barrier to our accurate understanding of the numbers in the works of five major ancient Greek historians by providing a standard against which their credibility can be more accurately judged. This systematic, quantified study is based on the compilation of statistics

concerning a standard constellation of aspects of all the numbers in the historical works of the five earliest wholly or at least substantially surviving ancient Greek historians: Herodotus, Thucydides, Xenophon (Anabasis and Hellenica), Polybius, and Diodorus Siculus. Such a comprehensive study has not been attempted before. For scholars reading and writing about the history of ancient Greece the volume offers a tool for interpreting the numbers in these ancient texts with more sensitivity to the world in which they were written. Standard aspects of number use captured by the coding system are: the different types of number (cardinals, ordinals, compounds, and non-explicit but definite numbers); the subject category to which each number belongs (Time, Distance-Size, Military, Population, Money, and Miscellaneous); and the types of any qualifications attached to it (Approximating, Comparative, Alternative, and Emphatic). The statistics also facilitate comparisons of every aspect of number use between authors and texts, enabling the delineation of a numeric profile for each one. This allows us to read these texts with a greater sensitivity to how they might have sounded to the author and his original readers, thus providing a firmer foundation for reconstructing or interpreting ancient Greek history.
